Trends in Demand for New Physicians, 2005-2010 A Summary of Demand Indicators for 35 Physician Specialties

School of Public Health University at Albany, State University of New York

Trends in Demand for New Physicians, 2005 - 2010

A Summary of Demand Indicators for 35 Physician Specialties

September 2011

Center for Health Workforce Studies School of Public Health, University at Albany, State University of New York 1 University Place / Suite 220 Rensselaer, NY 12144-3445 Phone: (518) 402-0250 <u>http://chws.albany.edu</u>

ACKNOWLEDGEMENTS

This report was prepared by David P. Armstrong and Gaetano J. Forte of the Center for Health Workforce Studies. The authors wish to acknowledge the editing efforts of Lyrysa Smith. Funding for the 2010 Resident Exit Survey and analysis was provided by the New York State Department of Health. The Center would like to express its appreciation to the GME administrators and directors at participating teaching hospitals for their efforts to ensure a high response rate to the Resident Exit Survey each year. Without their assistance this important data collection effort would not be possible.

BACKGROUND

The Center for Health Workforce Studies conducts an annual survey of all physicians completing a residency or fellowship training program in New York (the Resident Exit Survey). The survey instrument (see Appendix B) was developed by the Center in consultation with teaching hospitals in New York. The survey provides the medical education community with valuable information on outcomes of training and demand for new physicians in different specialties.

Each spring, the Center distributes the surveys to Graduate Medical Education (GME) directors and administrators at teaching hospitals in New York. In most cases, surveys are then forwarded to individual GME departments at each hospital which assume responsibility for having graduating residents and fellows fill out the surveys in the weeks prior to program completion. The surveys are then returned to the Center for data entry and analysis.

The year 2010 marked the eleventh year of the survey. Through the excellent collaboration of teaching hospitals throughout the state, *an aggregated total of 32,695 of the 52,513 graduates have completed the survey (62% response rate)* for the eleven years the survey has been conducted (1998, 1999, 2000, 2001, 2002, 2003, 2005, 2007, 2008, 2009, and 2010). Many of the questions on the Resident Exit Survey are designed to assess demand for physicians in general, and by specialty. In any given year, the Resident Exit Survey provides a snapshot of the physician marketplace at a specific point in time. By conducting the survey on a regular basis, trends may be observed which are useful in projecting future supply and demand.

This data book presents profiles for 35 specialties. Each specialty profile summarizes trends in five key areas related to physician supply and demand: starting income, job offers, having to change plans due to limited practice opportunities, relative demand, and numbers of graduates. Data on starting income, job offers, having to change plans, and relative demand are based on responses to the Resident Exit Survey in New York (for the years 2005 to 2010). Data on GME graduates are from the annual medical education issues of the *Journal of the American Medical Association (JAMA)* and summarize the numbers of residents (or fellows) completing allopathic GME training programs in the U.S. in the specialty from 2000 to 2009. Definitions of the five areas are as follows:

- Starting income: The median starting income of survey respondents with confirmed plans to enter patient care/clinical practice in the U.S. following completion of their training program. Starting incomes included respondents' base salaries plus their expected incentive/bonus income. Furthermore, starting incomes were adjusted for inflation to reflect 2010 dollars and are reported in \$1,000s.
- Job offers: The mean number of job offers for employment/practice positions of survey respondents who had actively searched for a practice position, excluding international medical graduates (IMGs) on temporary visas. Respondents with temporary citizenship status were excluded from this analysis because they were much more likely to experience difficulty in finding a practice positions due to visa restrictions.
- Having to change plans due to limited practice opportunities: The percentage of respondents who had actively searched for a job (excluding IMGs on temporary visas) and who had to change their plans due to limited practice opportunities.

- Relative demand: Using several questions pertaining to the job market experiences and perceptions of survey respondents who had actively searched for a practice position (excluding IMGs on temporary visas), a composite score was computed to assign an overall rank (or relative demand score) for each specialty in each year that the survey was conducted. The percentages presented are the percentile rank of the specialty amongst all specialties in a given year. A percentile rank of 100% identifies the specialty highest in demand, and the lowest percentile rank would correspond to the specialty with the lowest relative demand score. Appendix A provides a detailed explanation of the methodology used to assess relative demand.
- Numbers of graduates of allopathic GME training programs in the U.S.: The American Medical Association's (AMA) data on the number of residents completing training was compiled to observe how the number of new entrants to the physician marketplace has changed over time.

KEY FINDINGS

For the second consecutive year the job market for new physicians was weaker when compared to the previous year, but overall the market continues to be good. With the exception of the last two years, analysis of trends in variables pertaining to the physician job market revealed that opportunities for physicians entering practice in most specialties have improved or remained stable over the period the Center has been conducting this survey.

In 2010, demand for primary care physicians (generalists) was stronger than the demand for non-primary care physicians (specialists).^{*} Historically, resident exit survey data showed that demand for generalists has been lower compared to demand for specialists. Over the past few years, however, demand for generalist has surpassed demand for specialists. In 2010, primary care physicians received more job offers than specialists and were less likely to have to change plans due to limited practice opportunities.

There are important differences in the job market experiences and assessments for different specialties. Although the overall marketplace appears relatively good for new graduates, there exist important differences in demand for individual specialties. In New York, specialties experiencing the strongest and weakest relative demand were:

- Strongest relative demand: urology, otolaryngology, family medicine, gastroenterology, dermatology, general anesthesiology, and emergency medicine.
- Weakest relative demand: cardio-thoracic surgery, plastic surgery, nephrology, infectious disease, pathology, and ophthalmology.

IMPORTANT NOTE

For each specialty the number of responses by year is listed at the bottom of the page in the report. Care should be taken when interpreting outcomes based on small samples because the measures may fluctuate greatly from year to year.

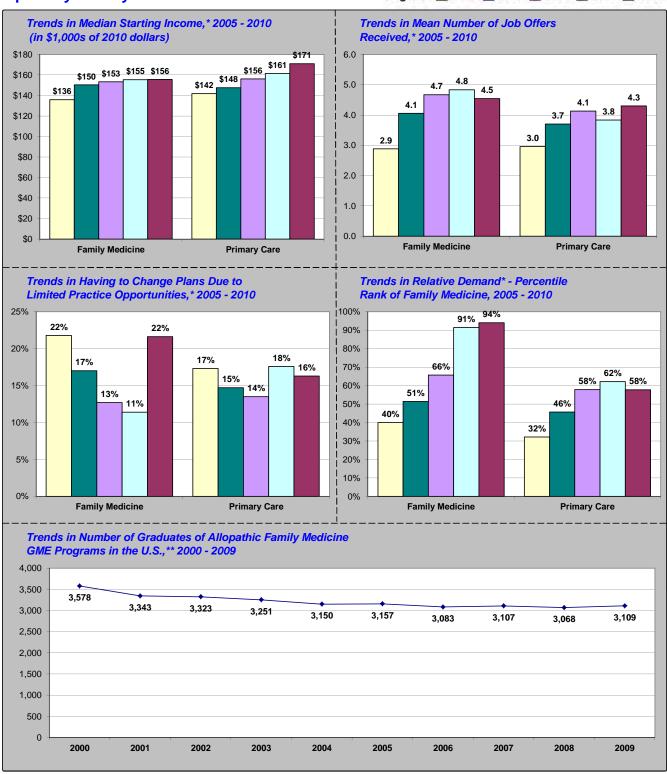

^{*} Primary care (or generalists) specialties include family medicine, general internal medicine, general pediatrics, and internal medicine and pediatrics (combined).

APPENDIX A. Methodology Used to Measure Relative Demand

The Resident Exit Survey cannot be used to determine *absolute* demand for new physicians in different specialties (i.e., it cannot be used to determine the number of physicians necessary to serve a given population). However, by analyzing several questions pertaining to job market experiences and perceptions of new physicians and comparing responses over time, in different geographical locations, and between specialties, it is possible to assess whether respondents from certain specialties or in certain locations are finding more or fewer practice opportunities (i.e., it measures *relative* demand).

The implication is that while a specialty, such as pathology, may be in low demand relative to other specialties in an absolute sense, there may still be good opportunities for pathologists, but not as good or as many as another specialty that is seeing higher demand (such as child and adolescent psychiatry). In addition, it is not possible to measure the magnitude of the difference in demand between different specialties. So, if the percentile rank of family medicine in New York in 2010 was 94% (i.e., family medicine had a relative rank equal to or better than 94% of the 35 specialties that were ranked), and the percentile rank of radiology was 46%, this *does not* imply that demand for family medicine was more than twice as strong as for radiology. The scale is only ordinal.

To measure demand for a given year, a composite score was computed by taking the median of the ranks (i.e., where each specialty stood relative to all 35 specialties) scored by each specialty on each of the demand indicators for data from the previous four years of the survey. Data from more recent years of the survey received a greater weight than data from earlier years. For example, when calculating the demand score for 2010, data from 2010 were weighted .40, data from 2009 were weighted .30, data from 2008 were weighted .20, and data from 2009 were weighted .10. The following variables were used as indicators of demand:

- ✓ percentage of respondents having difficulty finding a satisfactory practice position;
- ✓ percentage of respondents having to change plans due to limited practice opportunities;
- ✓ mean number of job offers received by respondents;
- ✓ respondents' mean Likert score summarizing their assessment of the regional job market;
- ✓ respondents' mean Likert score summarizing their assessment of the national job market; and
- ✓ trend (i.e., average annual change) in median starting income.

None of these indicators used alone will provide a perfect picture of demand. However, considered together, they provide a good picture of relative demand by specialty. There was a high degree of correlation between the "percentage of respondents with difficulty finding a satisfactory practice position" variable and the "percentage of respondents having to change plans due to limited practice opportunities" variable (i.e., a respondent reporting "difficulty..." was much more likely to also report "having to change plans..."). There was also a high degree of correlation between respondents' assessments of the "regional job market" and the "national job market." For this reason, the "job offers" variable and the "trends in starting income" variable were each double weighted in computing a composite demand score.

The table on the next page summarizes the rank of each specialty (ranked among 35 specialties) on each demand indicator. The variables are:

- ✓ <u>diff</u>: rank of each specialty based on the percentage of respondents reporting difficulty finding a satisfactory practice position→e.g., the specialty with the lowest percentage of respondents reporting difficulty (otolaryngology) ranked #1 and the specialty with the highest percentage of respondents reporting difficulty (cardio-thoracic surgery) ranked #35.
- ✓ <u>chpln</u>: rank of each specialty based on the percentage of respondents that had to change plans due to practice opportunities →e.g., the specialty with the lowest percentage of respondents having to change plans (otolaryngology) ranked #1 and the specialty with the highest percentage of respondents reporting difficulty (cardio-thoracic surgery) ranked #35.
- ✓ <u>offrs</u>: rank of each specialty in terms of the mean number of job offers received by respondents (this variable was double weighted in computing the overall demand score)
 →e.g., the specialty with the most job offers (pulmonary disease) ranked #1 and the specialty with the fewest job offers (cardio-thoracic surgery) ranked #35.
- ✓ reg mrkt: rank of each specialty in terms of the mean Likert score summarizing respondents' assessments of the regional job market for their specialty→e.g., the specialty with the most positive assessment of the regional job market (adult psychiatry) ranked #1 and the specialty with the least positive assessment of the regional job market (cardiothoracic surgery) ranked #35.
- ✓ <u>nat_mrkt</u>: rank of each specialty in terms of the mean Likert score summarizing respondents' assessments of the national job market for their specialty→e.g., the specialty with the most positive assessment of the national job market (urology) ranked #1 and the specialty with the least positive assessment of the national job market (cardio-thoracic surgery) ranked #35.
- ✓ <u>inc_trnd</u>: rank of each specialty in terms the average annual change (or trend) in median starting income levels of respondents from each specialty→e.g., the specialty with the strongest trend in median starting income (plastic surgery) ranked #1 and the specialty with the weakest trend in median starting income (IM & Peds (combined)) ranked #35.

SUMMARY	' OF RANKS ON DEMAND INDICATORS

Pediatric Subspecs	20	25	31	27	26	14	25.5	27.0	26%
Pediatric Subspecs Phys Med & Rehab	20 19	23	18	19	20	26	20.5	17.0	54%

*The job offers variable and the income trend variable were each double weighted in computing the median rank.

**The percentile rank is the percentage of all 35 specialties with a median demand rank equal to or lower than each specialty.

The following example illustrates how the demand score was calculated for family medicine in New York in 2010:

Median Rank_{FM} = median (diff, chpln, offers, offers, reg_mrkt, nat_mrkt, inc_trnd, inc_trnd)

Median Rank_{FM} = median (8, 11, 3, 3, 7, 8, 22, 22)

Median Rank_{FM} = 8.0^{***}

***With a median rank of 8.0, family medicine ranked 3 out of 35 specialties. The percentile rank is computed as:

 $% \operatorname{rank}_{FM} = \{ 1 - (\operatorname{Rank}_{FM} / \#\operatorname{specs}) + (1 / \#\operatorname{specs}) \} \text{ where "#specs" is the}$

number of specialties being ranked. In New York in 2010, there were 35 specialties being ranked, so the percentile rank of family medicine is:

 $% \operatorname{rank}_{FM} = \{ 1 - (3/35) + (1/35) \} \ge 94\%.$

APPENDIX B. Specialty Comparison Groups

SPECIALTY COMPARISON GROUPS

Specialty	Comparison Group [*]
Family Medicine	Primary Care
General Internal Medicine	Primary Care
General Pediatrics	Primary Care
IM & Peds (Combined)	Primary Care
Obstetrics/Gynecology	Non-Primary Care
Cardiology	Medicine Subspecialties
Critical Care Medicine	Medicine Subspecialties
Endocrinology & Metabolism	Medicine Subspecialties
Gastroenterology	Medicine Subspecialties
Geriatrics	Medicine Subspecialties
Hematology/Oncology	Medicine Subspecialties
Infectious Disease	Medicine Subspecialties
Nephrology	Medicine Subspecialties
Pulmonary Disease	Medicine Subspecialties
Rheumatology	Medicine Subspecialties
General Surgery	Non-Primary Care
Neurosurgery	Surgical Subspecialties
Ophthalmology	Surgical Subspecialties
Orthopedic Surgery	Surgical Subspecialties
Otolaryngology	Surgical Subspecialties
Plastic Surgery	Surgical Subspecialties
Cardio-Thoracic Surgery	Surgical Subspecialties
Urology	Surgical Subspecialties
Anesthesiology	Non-Primary Care
Pain Management	Non-Primary Care
Pathology	Non-Primary Care
Radiology	Non-Primary Care
Adult Psychiatry	Non-Primary Care
Child & Adolescent Psychiatry	Non-Primary Care
Allergy & Immunology	Non-Primary Care
Dermatology	Non-Primary Care
Emergency Medicine	Non-Primary Care
Neurology	Non-Primary Care
Pediatric Subspecialties	Non-Primary Care
Physical Medicine & Rehabilitation	Non-Primary Care

*In each specialty profile, statistics for the specialty are presented next to the average of all specialties in the group to which the specialty belongs (i.e., the comparison group). As an example, the starting median of family practice is compared to the median starting income of all primary care. Likewise, the relative demand (or percentile rank) of cardiology is compared against the average percentile rank of all medicine subspecialties. **APPENDIX C. 2010 NY Resident Exit Survey Instrument**
