PREFACE

This report presents extensive data on New York City's physician workforce in 2000. It is designed to provide planners, policymakers, and the public with information to measure and better understand the distribution of physician resources at the city, borough, and neighborhood levels.

The report presents a variety of data for the city, the five boroughs, and each of the 41 neighborhoods defined by the United Hospital Fund of New York. To the extent possible, data are presented at the smallest level of aggregation to facilitate meaningful comparisons between neighborhoods and boroughs. Please refer to the Appendices at the end of the Report for information about the data used and their limitations.

HIGHLIGHTS

Physician Distribution

- A total of 26,438 patient care physicians were actively practicing in NYC in 2000.
- More than a third of these physicians (37%) practiced in a primary care specialty (family/general practice, general internal medicine, general pediatrics, and obstetrics and gynecology).
- Physicians are not evenly distributed across the city:
 - Half of the patient care physicians (50%) practice in Manhattan;
 - The other half are distributed across the boroughs as follows:
 - Brooklyn-20%
 - Queens-16%
 - Bronx-10%
 - Staten Island-4%
- Manhattan's dominance is seen in the ratio of physicians per 100,000 persons:
 - Manhattan has 860 physicians per 100,000;
 - The other boroughs cluster at close to 205 per 100,000, ranging from Staten Island at 263 to Queens at 191.
- Manhattan also has a similar preponderance of primary care physicians:
 - In Manhattan the ratio is 239 per 100,000;
 - The other boroughs cluster at close to 95, ranging from Staten Island at 110 to the Bronx and Queens at 93.
- Manhattan also had a preponderance of non-primary care physicians
 - In Manhattan the ratio is 621 per 100,000;
 - The other boroughs cluster around 110, ranging from Staten Island at 152 to Queens at 98.

Physician Characteristics

- Key demographics
 - Average age was 52 years
 - 28% are female
 - 10% unrepresented minorities* (African-Americans and Latino)
- Training highlights
 - 34% are graduates of NYS medical schools
 - 41% are International Medical Graduates (IMGs)
 - 83% received graduate medical training in NYS
 - 87% board certified

Practice Characteristics

- When full-time practice is defined as 40 hours weekly, the 26,438 active patient care physicians equal 23,687 full-time equivalent (FTE) physicians
- For the most part, physician FTEs are distributed in the same fashion as the actual number of physicians. This was the case for both geographic distribution and specialty distribution
- Practice setting highlights
 - 53% practice privately
 - 24% practice in hospitals
 - 2% practice in freestanding health centers/clinics (Diagnostic and Treatment Centers)

* Members of racial/ethnic groups that make up a larger portion of the general population than they make up of the physician population (e.g., African Americans; Latinos).

ACKNOWLEDGMENTS

Funding for the preparation of this report was provided by the United Hospital Fund of New York.

The New York State Education Department coordinated the distribution and collection of the survey questionnaires used to gather much of the data presented in this report as part of its re-registration of physician licenses in New York State.

DATA DETAILS

Included in this appendix are technical details that should be considered when using this report.

New York State Physician Licensure Re-registration Survey

Data from the Center for Health Workforce Studies' 1997-1999 New York State Physician Licensure Re-registration Survey are the backbone of this report. Physicians in New York are required to re-register their licenses with the Education Department every 2 years on a rolling basis. In the re-registration materials sent to each physician, a survey is included with questions related to sociodemographic characteristics, medical education and training, and practice patterns. During the 1997-1999 cycle, 57% of the physicians who re-registered their licenses completed the survey. For the purposes of this report, these data were supplemented with additional data from a variety of sources to account for the physicians who did not respond to the survey as well as any missing information. The data in this report represent all physicians actively providing patient care services in New York City.

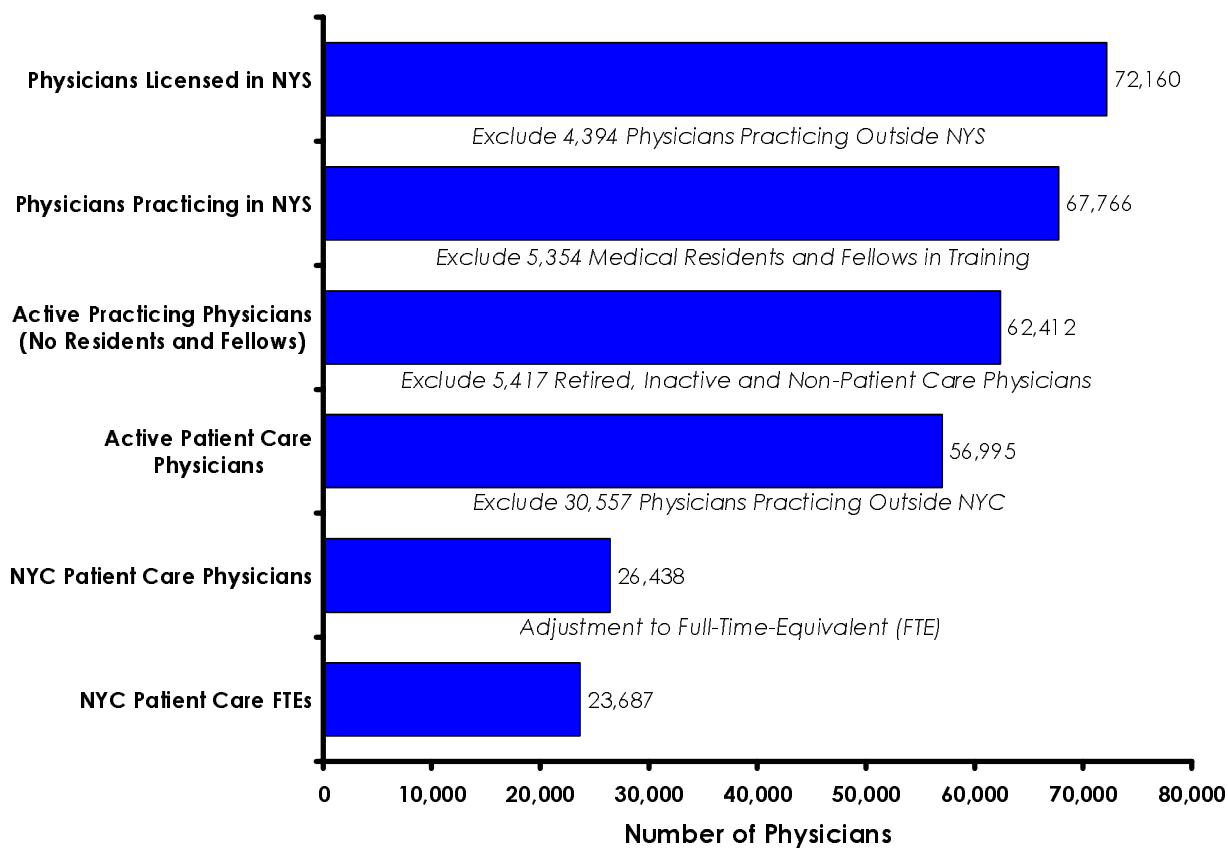

Identification of Patient Care Physician in NYC

As of December 31, 1999, there were 72,160 physicians licensed in New York State. Since the focus of this report was physicians actively providing patient care services in New York City, identification of these physicians was a priority. Figure A-1 presents the steps in process of the identification of these physicians. The first step was to exclude the 4,394 physicians who practice outside of the borders of the state, leaving 67,766 physicians who practice in the state. Next, 5,354 physicians were excluded who were either medical residents or fellows in training, leaving 62,412 post-graduate physicians. Next, 5,417 retired, inactive, or otherwise non-patient care physicians were excluded, leaving 56,995 active patient care physicians. Next, 30,557 physicians providing patient care services outside of the New York City were excluded, leaving 26,600 active patient care physicians. Finally, an adjustment to a standard Full-Time-Equivalent (see below for the adjustment details) was made reducing the effective number of active patient care physicians to 23,687 in New York City.

FTE Adjustment

In order to create a standard measure of supply, physicians were assigned FTE values base on the number of hours they reported spending in direct patient care per week. The FTE standard used was 40 hours per week spent in direct patient care. FTEs were calculated by dividing a physician's total patient care hours per week by 40.

Figure A-1. New York City Patient Care Physician Identification

Population Data

The population data used to calculate the ratios of physicians and physician FTEs per population were obtained from the New York City Department of City Planning based on the 2000 US Census. Specifically, “Table SF1 P-7A: Total Population by Single Years of Age and Sex, New York City ZIPCODES, 2000,” was downloaded from the NYC DCP’s website: <<http://www.ci.nyc.ny.us/html/dcp/download/census/sf1p7a.xls>> (16 April 2003).

ITEM RESPONSE RATES

Figure A-2 presents the item response rates for the variables that make up this report. With respect to patient care hours, the item response rate was just over 52%. While this is a somewhat low item response rate, for the physicians with missing patient care hour information, data points were imputed using estimates that simultaneously accounted for the key variables that determine patient care hours (gender, age, and specialty of the physician). Very few physicians (less than < 0.50%) were missing information on the gender, age, of the physician and somewhat more (17.20%) were missing information on the race/ethnicity of the physician. Age and race/ethnicity missing values were not imputed, but rather distributions were reported for those with valid responses only.

Figure A-2. Item Response Rates

Variable	Item Response Rate
Patient Care Hours	52.64%
Gender	99.98%
Age	99.95%
Specialty	99.52%
Race/Ethnicity	82.80%
